

ABSTRACT OF THE DISCLOSURE

1
2 A circular sawing machine includes a base, a saw seat movable
3 relative to the base, and a link mechanism pivotally mounted between the base
4 and the saw seat, so that the saw seat is linearly movable relative to the base.
5 Thus, the link mechanism can absorb vibration or shock during operation of
6 the circular saw blade so as to provide a shock-absorbing effect the circular
7 saw blade, so that the circular saw blade can be operated smoothly and stably.
